Dear AssetBooker User,

We wanted to make you aware of a recent announcement from Microsoft regarding the future of **Dataverse for Teams**, the platform on which AssetBooker is currently built. Microsoft has announced that Dataverse for Teams will be deprecated, with existing environments continuing to operate until September 2027 before being retired in October 2027.

Important changes (deprecations) coming in Power Platform - Power Platform | Microsoft Learn

We understand that this announcement may raise questions regarding the future of AssetBooker and any potential licensing implications.

Please be assured that:

- **There is no immediate action required from existing AssetBooker customers.**
- **AssetBooker will continue to operate as normal.**
- DigPacks is already reviewing the available options and developing a clear path forward for customers.
- We are committed to providing a solution that protects our customers' investment in the platform and minimises disruption.
- Any future approach will be communicated well in advance of Microsoft's retirement timelines.

Our technical team is currently assessing a number of options, including migration and alternative deployment models, to ensure that customers have a practical and cost-effective route forward.

We will provide a further update by November 30th 2026 outlining:

- The impact on different customer scenarios.
- The options that will be available through DigPacks.
- Any associated licensing considerations.
- Our recommended approach for existing AssetBooker deployments.

At this stage, our focus is on reviewing the available options and identifying the solution that delivers the best balance of functionality, cost and long-term sustainability for our customers.

Thank you for your continued support of AssetBooker.

Please be assured that the DigPacks team is actively investigating the available options and working closely within the Microsoft guidance. As soon as our assessment is complete we will communicate a clear way forward to support your organisation.

DigPacks Team
